

The LeakAlertor 6000

The LeakAlertor 6000 is a patented smart device that electronically monitors your toilets for leaks, running toilets, and other water wasting problems. The LeakAlertor identifies the faulty part then alerts you both visually and audibly BEFORE you leave the bathroom.

Features

- Installs in seconds - no tools required!
- Fully Automatic - no setup necessary!
- Works on all tank based toilets!
- Visual & audible alert systems
- Replaceable battery

LeakAlertor Can Detect:

- Wide-Open/Stuck Flappers
- Toilet Overflows
- Leaking Flappers/Flush Valves
- Fill Valve Equilibrium

An open flapper can waste up to **200 gallons of water an hour**. (Source: US EPA)
20 to 35 percent of tank-toilets leak to some degree. (Source: The Alliance for Water Efficiency)

The LeakAlertor 6000 could pay for itself the first time it detects a problem

How does the LeakAlertor 6000 work?

The rise and fall of water inside the tank is the heartbeat of a toilet. The rate at which the water rises and falls, under varying conditions, determines the health of the toilet. The LeakAlertor is a diagnostic tool used to monitor your toilet's health. In the simplest terms, the LeakAlertor uses complex mathematical functions to determine when these changes in water height indicate a running toilet, toilet leak, or faulty fill valve on any tank-based toilet. The LeakAlertor then alerts users with simple flashes and beeps.
